Non-Stop Security

for Service Providers

Kaspersky Non-Stop Security for xSPs is an ideal solution for service providers who face the challenges of finding additional sources of income and staying ahead of competitors. By offering their customers a full-scale desktop security solution, service providers can easily extend their range of services and develop an additional income-generating scheme. This solution was specifically developed to provide the flexibility and convenience of subscription-based services for antivirus software.

Overview

Kaspersky Non-Stop Security for xSPs implements software using a service model and enables service providers to offer their customers an antivirus solution on a monthly subscription basis. This turn-key solution includes all of the required elements needed to provide antivirus services:

The solution consists of two parts: the Kaspersky Non-Stop Security Client and the Kaspersky Keep Alive Management Center. The server component has an intuitive interface, and can be easily connected to any billing system. The service provider installs Kaspersky Keep Alive Management Center and the update server mirror onto its environment, consolidating all required services in one place. This scheme allows the service provider to control and manage all user activities.

Integration Process

A simple and flexible integration process, assisted by Kaspersky Lab experts, enables the service provider to quickly activate new services. Cross-platform compatibility and easy customization allow the solution to be integrated into any environment.

Co-branding & Customization

Service providers are able to offer the security service under their own brand. This allows them to use the same marketing channels for their entire product range. All customization is carried out by Kaspersky Lab.

Licensing Scheme

A flexible licensing scheme, with a minimum one-month subscription period, allows service providers to offer their customers a variety of subscription options, or a continuous subscription with an automated renewal process. The small monthly fee encourages users to subscribe to the service.

End-User Benefits

Client software is based on the innovative Kaspersky Lab Version 6.0 product line, using either the functionality of the full version of Kaspersky Internet Security 6.0 or just what is included in Kaspersky Anti-Virus 6.0. This enables users to combine the power of a complete security package with the flexibility of a subscription-based service.

Evaluation

Kaspersky Lab offers an easy to install, complete evaluation package, comprising a fully-functional server with a sample license database. The solution can be evaluated by simply installing it on any machine. Detailed technical information is available upon request.

Technology

As an established secure content management solution developer, Kaspersky Lab offers its partners a number of technological advantages, including:

- the fastest response to virus epidemics;
- the most frequent antivirus signature updates;
- exceptional detection rates combined with minimal false positives; and,
- easy access to new technical developments and information.
